**This information is based on the BC MOE Laboratory Manual, Standard Methods (APHA), EPA, and other applicable reference methods, and is subject to change. These are the minimum recommended volumes. Multiple analyses may be combined in a single container. Contact the lab if collection volume is uncertain. Samples should be kept  $\leq 10^{\circ}\text{C}$  during transport to the laboratory, with the exception of microbiological samples which should be kept  $\leq 8^{\circ}\text{C}$ .**

<sup>1</sup> These parameters ideally should be measured in the field, hence they will be qualified

<sup>2</sup> Must be submitted in a dedicated container, i.e. separate from other metals

<sup>3</sup> Container used to collect sample must have no headspace

<sup>4</sup> Sample must **not** be preserved if the dissolved/soluble fraction is required, unless it is filtered first

<sup>5</sup> Samples that are not field filtered (where applicable) and/or preserved will be qualified
